## INSIGHT

The Journal of the Titan Society
(Issue \#13, April 1987)
I have recently finished a renorming of the Mega rest and my results (reported on pages 3-7) give the test an Iq range of 120 to 190. Although the precise percentile meaning of these ive is still open to question, I have dropped the idea of raising the admission requirement from 43 to 46 and an considering lowering it instead to 41, which would be equivalent to an IQ of 180 according to this new norming. Your comments would be appreciated.

## A Short Biography

## Karl G. Wikman

I was born in the town of Helsingborg in southern Sweden 1943.
Judging from my ambidexterity, the genes from my parents seem to have been quite democratically distributed, having an artistic father and a rational reasoning mother.
Up to high school 1 was rather indifferent to the various disciplines and activities in school. The few exceptions that come to my mind are painting, algebra and later chemistry. I found the rest rather boring. My real interests between $7-13$ were reading astronomy, science-fiction and accounts of paranormal events. However, overshadowing these activities was my interest in chemistry, centering around the main issue: fabrication of explosives. When chemistry was introduced in the curriculum in the 7 th school-year, I had a fairly well-equipped laboratory and had synthetized most of the known explosives (no accidents:). By this time my keen interest in detonating items faded away and was replaced by building rockets, propelled by solid fuels.
After high school I went to study mathematics at the University of Gothenburg in 1963. I was quite successful and was offered a well paid appointment as a lecturer for undergraduate students in mathematics in 1965. However, I wanted to have some experience in the application of mathematics before 1 got completely stuck in its purer domains. So, I started with studying experimental physics. After having my M.Sc. in this subject $I$ made an excursion into pedagogy to have a degree at Teacher's training College in Gothenburg (the real reason: my studies were well paid) in 1969. From there, I started studies in theoretical physics. After a period of studies and travelling 1 was tempted by generous offer as a lecturer in theoretical solid state piystcs at the University of Lund in 1972, which I accepted.
At this time I felt a growing dissatisfaction with my work in theoretical physics, dealing manily with many-particle physics in the field of phase-transitions. wanted to have a better understanding of the fundamentals, especially the foundations of quantum mechanics. My professor did not share the same taste for these questions and l left the university in 1974.
Parallell with my academic work, l had been nourishing an interest in medicine, particularly the rationale behind the medical lore embodied in medical systems of ancient cultures. It was therefore not a big jump to engage myself in phytochemistry with applications in nutrition, medicine (including sc soft-acting drugs in naturopathic medicine) and foodindustry. Currently, I am developping processing technology for the extraction and purification of plant material. in a company owned by myself. Alongside, I am establishing a clearing house of information concerning both the ethnobotanical uses and the scientific documentation of plants.
I have not given up my interests in fouftational questions in physics. Since a couple of years 1 have become more and more involved in a group of people around prof. David Bohmat Birbeck College in London. To put it in a very condensed way, Bohm (together with prof. Hiley) has suggested a radical new way of describing physical processes. Starting from quantum theory, he is trying to resolve some very disturbing features of this theory by starting from scratch, building physics into a larger metaphysical framework. The primitive concepts in his theories are: process, wholeness and order(s), and on a technical level algebra(s) is the tool of choice. Personally, the most challenging aspects to me, lies in this general metaphysical framework, called soma-significance, where meaning is given an objective status in the description of reality. As perhaps can be seen from this short acoount, I prefer to work with both pragmatical issues and theoretical ones.

## A Third Noraing of the Mega Test <br> Ronald E. Hoeflin <br> P.O. Box 7430 <br> New York, NY 10116

I decided to norm the Mega Test this time using scores reported on three other tests: the Lengdon Adult Intelligence Teat, the California Test of Mental Maturity, and the Stanford-Binet. These 187 scores and the corresponding raw acores on the mega Test are reported in Table 1: 78 of them from the LAIT, 63 from the CTMM, and 46 from the S-B. These three tests were chosen, in part, because they all have 16 -point standard deviations, more or less, for the general population, making them fairly eimple to combine.

I Lound that the mean IQ for this sample of 187 scores was 148.92 and that the mean of the corresponding 187 raw acores was 20.53. The standard deviation of the 197 IQs was found to be 14.30 IQ points and that of the corresponding 187 raw acores was 9.57 raw acore points, yielding $14.30 / 9.57=2.494$ IQ points per raw score point. Using this scaling and setting 20.53 raw ecore points equal to 148.92 IQ, it was found that the floor of the test (l right) is 119.74 IQ, which can be rounded off to 120 IQ , and that the ceiling of the test ( 48 right) is 189.97 IQ , which can be rounded off to 190 IQ.

I was detered from accepting these iQs at face value for a long time because they imply that the one-in-a-million level of ability, which is theoretically at 4.7534 standard deviations above the mean, or 176.0544 IQ , would correspond to a raw score of 38.69 , which can be rounded off to 39. Fifty people have scored that high or higher on the Mega Test so far, almost all of them in the United States, which seemed like an unacceptably high number, since it amounts to about $20 \%$ of the potential pool of people at the one-in-a-milition level of ability, given the fact that the U.S. population is now almost $250,000,000$. Por the current distribution of scores of those who have attempted the Mega Test, after strenuous attempts were made to weed out all repeat attempts, see Table 2.

I understand that Omni magazine has a circulation of about 800,000 and a readership of about $4,000,000$, which is only about one person in aixty in the United States. But it is not unreasonable to suppose that these readers are largely within the brightest $10 \%$ of the population, so that perhaps one in six rather than one in sixty of this brightest sement of the population would have had exposure to my test. These considerations make the notion that my test was actually attempted by $20 \%$ of those whose ability is at or above the one-in-a-million level of ability seem far more plausible to me now than it did before.

Assuming, then, that the 1 Qs conform rouahly to the normal curve, I have assigned to each raw acore the IQs and percentiles that are reported in Table 3.

Table 1
Pairinge of previously reported IQs with the corresponding raw acores attained on the Mega Test

| 26 | 77 | 72 | 5 | 0 | 1 | 24 | 18 | 5 | 1 |
| 25 | 73 | 68 | 5 | 0 | 0 | 6 | 3 | 3 | 0 |
| 24 | 84 | 76 | 8 | 0 | Totals | 3625 | 3076 | 508 | 41 |
|  |  |  |  |  | Parcents | 100 | 85 | 14 | 1 |

Note: In further justification of setting the one-in-a-milion level at $a$ raw score of 39 , one finds that of the 50 participants who scored 39 or higher, 6 were not reaidenta of the United 3 tatea ( 3 were Canadian, 2 were residenta of England, and 1 was a reaident of Spain). As for the remaining 44 participants who were U.S. residente, it hould be noticed that if the 13 who cored 39 are opread evently over the interval from 38.5 to 39.5 , then about 2.5 of them would fall below the theoretical one-in-a-mililion line of 38.69. Thet leaven just 41.5 participants who are U.S. residenta and who are rated at or above the one-in-a-mililion level--about one-sixth of the potential pool of U.S. residents with ability at or above this level. Aseuning that moat of Omni's 4 million readers are U.S. residenta and that most of them are within the upper $10 \%$ in ability, it would appear likely that about one-sixth of the potential pool of persons with one-in-a-mililon ability levels in the U.S. would have eeen the teet. One then need merely surmise thet most permons at such an extrenely high level of ability would have attempted the test, which was prominently advertieed on the front cover of omi.

Table 3
The new norms

| Mega Score | 10 | 2-Score | Percentile | Ratio of Rarity |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 120 | 1.23 | 89 | 1 in 9 |
| 2 | 121 | 1.33 | 91 | 1 in 11 |
| 3 | 123 | 1.42 | 92 | 1 in 13 |
| 4 | 124 | 1.51 | 93 | 1 in 15 |

| 23 | 153 | 3.29 | 99.95 | 1 in 1,996 |
| 24 | 154 | 3.38 | 99.96 | 1 in 2,759 |
| 25 | 156 | 3.48 | 99.97 | 1 in 3,988 |
| 26 | 157 | 3.57 | 99.98 | 1 in 5,601 |
| 27 | 159 | 3.66 | 99.987 | 1 in 7,928 |
| 28 | 160 | 3.76 | 99.992 | 1 in 11,767 |
| 29 | 162 | 3.85 | 99.994 | 1 in 16,926 |
| 30 | 163 | 3.94 | 99.996 | 1 in 24,535 |
| 31 | 165 | 4.04 | 99.997 | 1 in 37,399 |
| 32 | 166 | 4.13 | 99.998 | 1 in 55,101 |
| 33 | 168 | 4.22 | 99.9988 | 1 in 81,813 |
| 34 | 169 | 4.32 | 99.9992 | 1 in 128,087 |
| 35 | 171 | 4.40 | 99.9995 | 1 in 184,606 |
| 36 | 172 | 4.50 | 99.9997 | 1 in 294,048 |
| 37 | 174 | 4.60 | 99.9998 | 1 in 472,893 |
| 38 | 175 | 4.69 | 99.99986 | 1 in 731,212 |
| 39 | 177 | 4.78 | 99.99991 | 1 in 1,139,491 |
| 40 | 178 | 4.88 | 99.99995 | 1 in 1,882,624 |
| 41 | 180 | 4.97 | 99.99997 | 1 in 2,982,593 |
| 42 | 181 | 5.06 | 99.99998 | 1 in 4,762,368 |
| 43 | 182 | 5.16 | 99.999987 | 1 in 8,083,935 |
| 44 | 184 | 5.25 | 99.999992 | 1 in 13,123,124 |
| 45 | 185 | 5.34 | 99.999995 | 1 in 21,471,390 |
| 46 | 187 | 5.44 | 99.999997 | 1 in 37,449,193 |
| 47 | 188 | 5.53 | 99.999998 | 1 in 62,297,530 |
| 48 | 190 | 5.62 | 99.999999 | 1 in 104,451,963 |

Postscript: These revised norms suggest that the cut-offs for the various high-IQ societies that accept the test ahould be modified as follows:

| $\quad$ Society | Minimum <br> Percentile |  | Old <br> Gut-otif | New <br> Cut-off |
| :--- | :---: | :--- | :---: | :---: |
| Triple Nine | 99.9 |  | 22 | 21 |
| I.S.P.B. | 99.96 |  | $22+$ vocab | 21 +vocab |
| Prometheus | 99.997 |  | $30-41$ | 31 |
| Mega | 99.9999 |  | $42-46$ | 39 |
| Titan | 99.99997 | 43 | 41 |  |

The cut-off's for Prometheus and Mega have fluctuated, depending on how I normed the test and, in the case of Prometheus, on what admisision percentile was used, so I have given the minimum and the maximum acores that were used.

Regarding the Titan Society, I previously rated a raw acore of 43 at the 99.999 percentile (one-in-100,000), but $I$ now rete it at the 99.999987 percentile (about.one-in-8,000,000). If the 6 pereons who acored 43 are spread over the interval from 42.5 to 43.5 , then 3 of them would be rated as exceeding 43.0. Six others scored 44 or more, so this makes a total of 9 persons rated at or above the one-in8,000,000 level. This figure is not as inplausible at ir might seen at first glance, since the U.S. alone has at least 30 persons who can potentially ecore at this level on ay test. One pertion who acored 45 Was a Iormer U.S. champion in the Japanese game of "go"--ranked third in the world among non-Oriental playere. One person who ecored 44 has a Ph.D. from M.I.T. and ie currently governor of New Hampahire, indicating high verbal as well se non-verbel abilities, to fudge from his education and profession. Another person who ecored 44 ie reted among the top recreational mathematicians in the U.S. and is a professor of mathematics at the University of Southern California. The "go" player mentioned above is also a professor of mathematics at USC with epecialties in coded communications and combinatorial geometry. A score of 45 is rated one-in-21,000,000 and a score of 44 in rated one-in-13,000,000, and these are the typen of people that one would indeed expect to find at these levels of ability.

Since a cut-off of one-in-8,000,000 seems bitexcessive, I am planning to revise the Titan adminaion level dowaward to the 180 IQ Level or one-in-3,000,000, which occura at maw ecore of. 41 . I will also adopt a more dignified name for the groupi the Hoeflin Research Group.

As for the other nocieties, they are free to accept or to reject my recommended revisions in the cut-offs as they see ilt, but I wild put the above cut-offs on my score report form unless otherwise instructed by the admisaions officerie of these groups.
